

PNEUMATIC ACTUATORS

PT series

Description

Our Pneumatic Actuator Series PT combines a number of custom-required features and based on its large and finely subdivided torque bandwidth it is the perfect solution for nearly all requirements in the field of valve automation.

The well proven rack&pinion construction ensures a durable and reliable usage in continuous operation even in harshest conditions and is the key to process reliability for decades. It provides maximum torque output in combination with compact and weight-saving design.

Through the structural design with internal slide-bearings, actuators of the PT series are completely main-

tenance free. All requirements of a simple service are achieved by the working principle and pre-loaded safety springs.

Thanks to the consideration of all common standards in respect of connection interfaces, PT-actuators provide maximum modularity in terms of combination with valves and accessories such as solenoid valves, position feedback systems or positioners.

Based on the usage of high quality stainless steel alloys and an additional powder coating, the actuators provide the highest level of corrosion-resistance and can be easily used in demanding environments.

Function

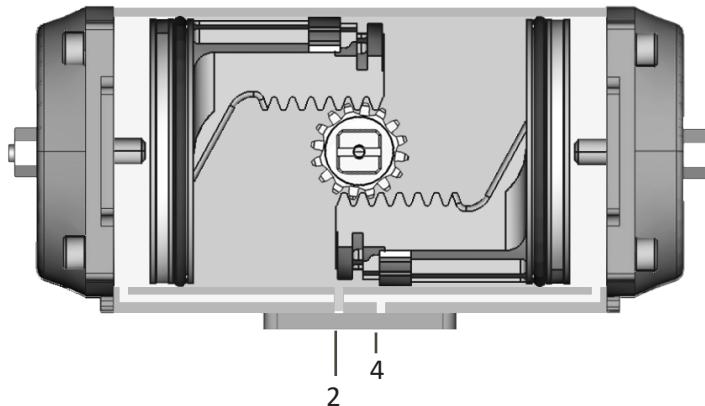

Actuators of the PT series are pneumatic double-piston rotary actuators, which are primarily used for the automation of quarter-turn valves such as ball valves, butterfly valves or plug valves. They are generally provided in two different functions: single acting and double-acting.

Double piston principle means that two pistons create two pressure chambers. By inflating one of these chambers the pistons are moved into opposite directions either towards or away from each other. The resulting force is provided to the central actuator pinion via toothed racks which are connected with the pistons and so creates a constant torque over the entire pivoting angle.

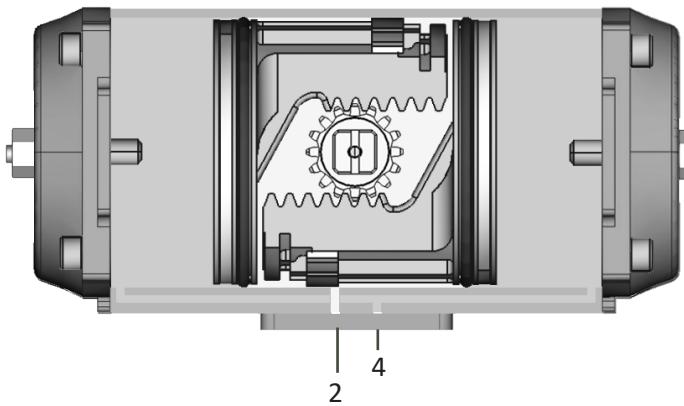

Double-acting function

In the double-acting actuator version, the movement in both directions gets generated by the control pressure.

Via connection port „A“ the pressure chamber between the two pistons gets pressurized and the pistons move out. The resulting force is transmitted to the pinion and effects a rotational movement.

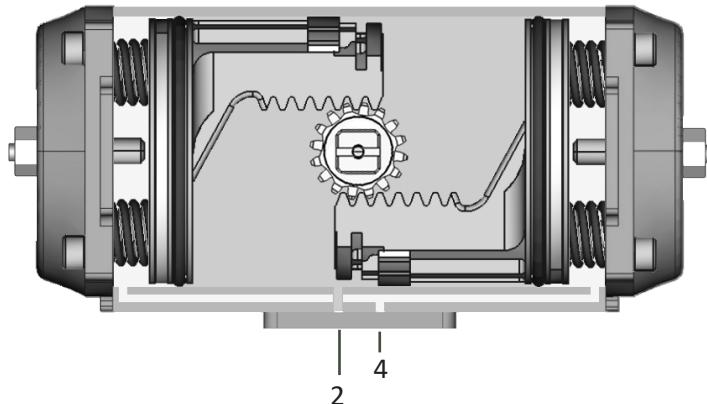

Once the outer pressure chamber is pressurized via connection port “B”, the pistons move towards each other again and the rotation process is reversed..

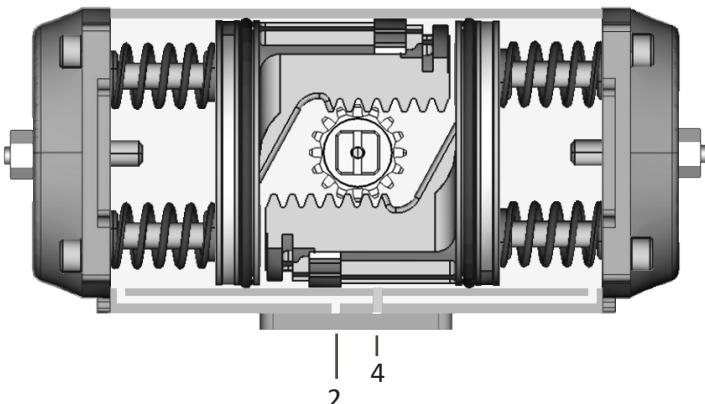

Single-acting function

In the single-acting actuator version, the movement into one rotation direction gets generated by the control pressure and the movement of the reverse rotation by integrated safety springs. Via connection port „A“ the pressure chamber between the two pistons gets pressurized, the pistons move out and compress the integrated spring cartridges. At the same time the force resulting at the pistons is transmitted to the pinion and effects a rotational movement.

Once the pressure chamber is vented via port „A“, the springs push the pistons towards each other and the rotation process is reversed.

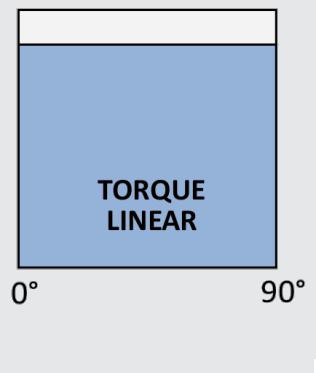

The single acting actuator version thereby provides a safety function for the case of pressure loss.

Torque

Torque diagram double acting

The double-acting actuator version provides a linear and constant torque over the complete pivoting angle in both pivoting directions.

| Size | Torque in Nm at control pressure in bar (g) | | | | | | | | | | | | |
|------------|---------------------------------------------|---------|-------|---------|-------|---------|-------|---------|-------|---------|-------|---------|-------|
| | 2 bar | 2.5 bar | 3 bar | 3.5 bar | 4 bar | 4.5 bar | 5 bar | 5.5 bar | 6 bar | 6.5 bar | 7 bar | 7,5 bar | 8 bar |

| 160 | 267 | 334 | 401 | 468 | 535 | 601 | 668 | 735 | 802 | 869 | 935 | 1002 | 1069 |

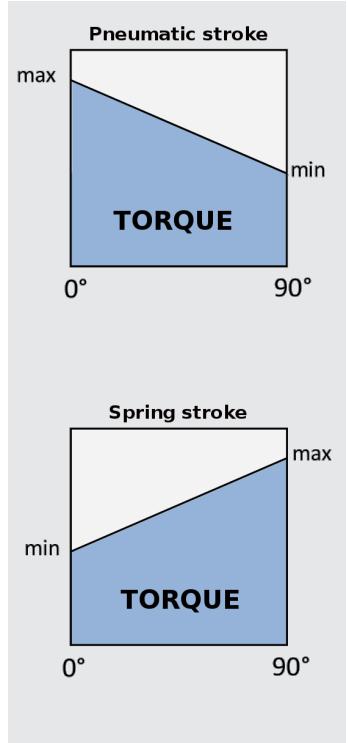

Torque diagram single acting

Single-acting actuators don't provide a consistent torque throughout the entire pivoting angle due to the integrated spring cartridges. We differentiate between the torque diagrams of the pneumatic stroke and the spring stroke.

At the beginning of the pneumatic stroke the springs are mostly relaxed and the maximum pneumatic torque is available for the valve-operation. In the course of the air stroke the springs get compressed and the rising spring force linearly reduces the available pneumatic torque to operate the valve. In the end position the torque of the air stroke reaches its minimum value, the so-called minimum pneumatic torque.

The spring stroke starts with maximum tensioned springs and accordingly offers the maximum spring torque at the beginning of the reverse movement. In the course of the spring stroke the springs progressively relax so that the actuator torque linearly reduces until it reaches the minimum spring torque in the end position.

Thus, at the starting point of each movement the maximum torque is available to overcome the breakaway torque.

Pivoting angle adjustment

All actuators of the PT series function via a stroke limiter, which in the switch position has a different setting range from standard values + 5 / -5, optionally even for the entire swivel range (also 100%).

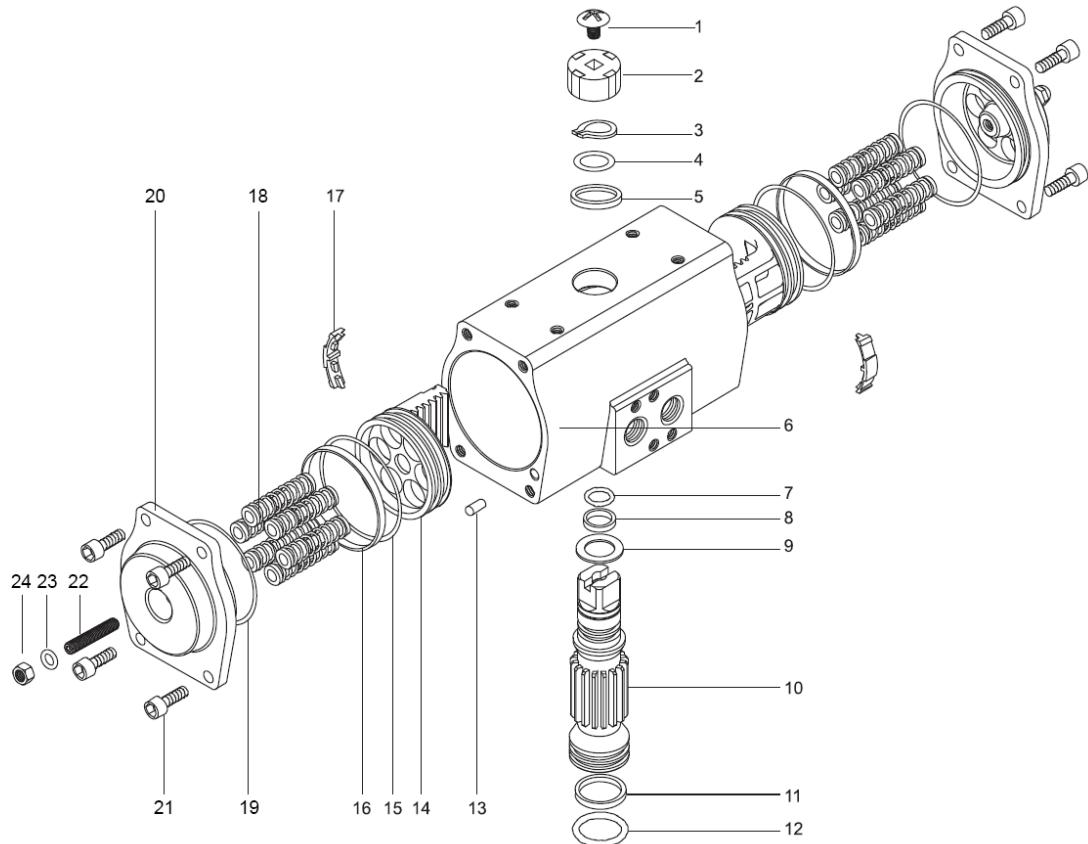

By turning the end-stop adjustment screws „A“, switch positions can be adjusted by +/- 5° for a precise setting of the final valve position. The according settings are secured by tightening the lock nuts.
